

LAGOTTO ROMAGNOLO BREED STANDARDS

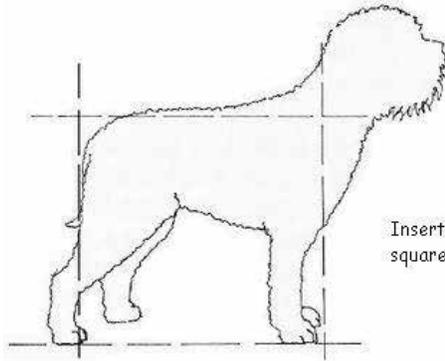

01: Important Proportions

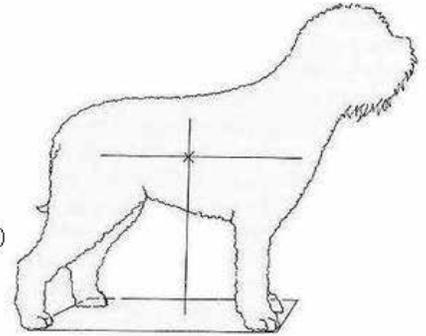

The length of the head is 4/10 of the height at the withers. The dog is nearly as high as long (square). The length of the skull should be slightly more than 50 % of the total length of the head. The length of the muzzle is 2/10 less than that of the skull (44 % to 56 %). The depth of the chest is less than 50 % (about 44 %) of the height at the withers.

Roof-like rump, incorrect

Inserted in square (correct)

Inserted in rectangle (incorrect)

Head

Viewed from above, trapezoidal in shape and moderately broad; the upper longitudinal axes of the skull and the muzzle diverge slightly.

Correct

Incorrect

Incorrect

Incorrect

02: Cranial Region

Skull: Wide at the level of the zygomatic arches, and as long as wide. Viewed from the side, from occiput to stop, the skull should be longer than the muzzle. It is slightly convex and tends to flatten out at the back skull. Frontal sinuses well developed, superciliary arches marked, medio-frontal furrow pronounced, occipital crest short and not very developed, supraorbital fossae slightly marked.

Stop: Not too pronounced but evident.

03: Facial Region

Nose: Large with wide open and mobile nostrils. Median groove strongly pronounced. Viewed in profile, the nose continues on the same level as the muzzle and protrudes very slightly from the front edge of the lips. The colour ranges from light to dark brown, depending on the colour of the coat.

Muzzle: Fairly broad, a little shorter than the skull (ratio : skull 56 %, muzzle 44 %), its depth being only slightly less than the length. It is slightly wedge shaped, giving a rather blunt profile. The nasal bridge has a straight profile.

Lips: The lips are not too thick; they are rather tight, so that the lower profile of the muzzle is determined by the mandible. They are covered with a long and rather bristly moustache. Viewed from the front, the lips form a wide semi-circle. The colour of the edges ranges from light to dark brown

Jaws / Teeth: Jaws strong with almost straight branches and a relatively large mandibular body. Complete scissor or pincer bite with white and well developed teeth. Reverse scissors bite acceptable.

The nose plane protrudes too much from the front face of the lips (the angle is less than 81-87), incorrect. The upper longitudinal axes are parallel, incorrect

Short muzzle (less than 44% of total length of the head) incorrect.

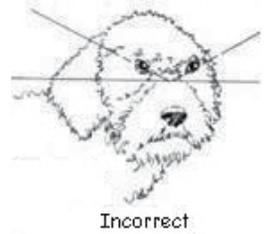

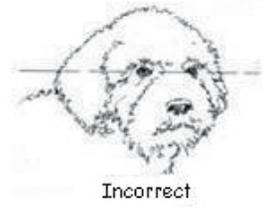

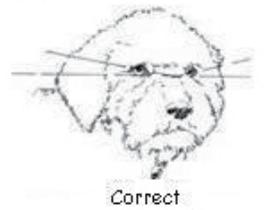

Too pronounced stop, incorrect

03: Facial Region (Continued)

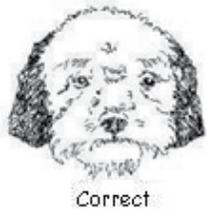

Bite: Scissor, reverse scissor (undershot within 3mm or level bite) is acceptable. An overshot jaw is not acceptable.

Cheeks: Flat

Eyes: Large, but never exaggerated, rounded, filling the socket, set fairly apart. The colour of the iris ranges from ochre to hazel and dark brown depending on the colour of the coat. Close fitting eyelids; the colour of the eye-rims ranges from light to dark brown. Eyelashes very well developed. Look alert, expression keen and lively.

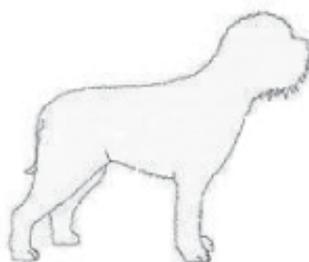

Ears: Medium-sized in proportion to the head, triangular with rounded tips; their base is rather wide; they are set just above the zygomatic arches. Hanging at rest or slightly raised when the dog is attentive. If pulled towards the nose they should reach the muzzle at 1/4 of its length. On the ears, the hair tends to show looser curls, but remains very wavy. No short hair on the ears. The inner part of the auricle is also covered with hair.

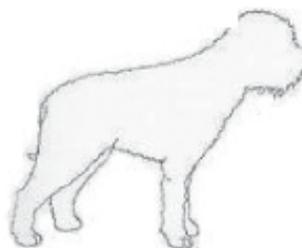

Neck: Strong, muscular, lean, of oval cross section; well set off from the nape and absolutely free from dewlap, slightly arched. In males the perimeter of the neck can reach the double of its length. The length of the neck is a little less than the total length of the head.

Body: Compact and strong; as long as the height at the withers.

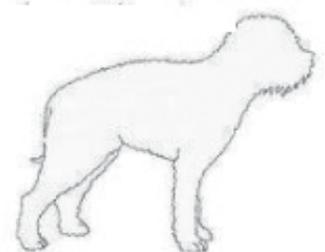

Topline: Straight from the withers to the croup.

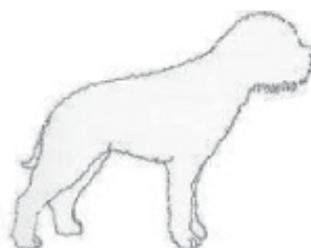

Rectilinear topline, correct, the withers a little bit higher than the rump, the ideal lagotto

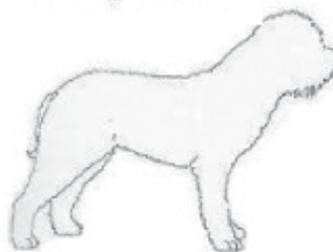

Too slope topline, incorrect, too high withers, incorrect

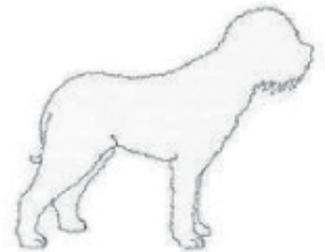

Humped topline, incorrect

Too slope topline, incorrect, too tilted rump, incorrect

Rectangular body, incorrect, dished topline, incorrect, too high rump, incorrect

Dished topline, incorrect, too high rump, incorrect

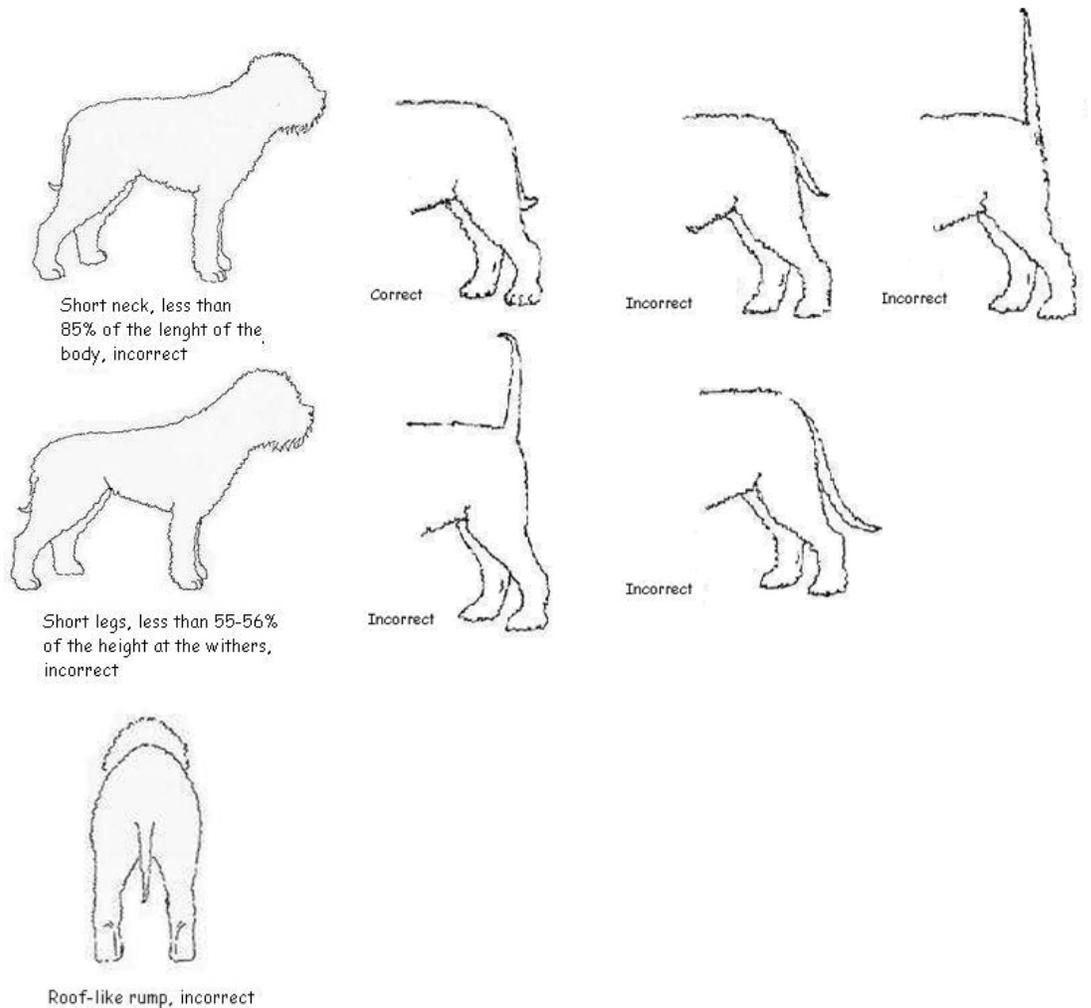

Withers: They rise above the level of the croup; the highest points of the shoulder blades are not too close, but quite high set and well laid back. **Loin:** Short coupled, very strong, in profile slightly convex. Width is equal or slightly exceeds the length.

Croup: Long, wide, muscular, slightly sloping (coxal inclination ranges from 25° to 30°).

Chest: Well developed, reaching down to the elbows. Although fairly narrow in front, from the sixth rib the chest widens backwards.

Underline and Belly: Long sternal section in form of a straight line; the following tuck-up is only slight.

Tail: Set on neither too high nor too low tapering towards the end. When hanging, it should barely reach the hocks. It is covered with woolly and rather bristly hair. At rest carried scimitar like; when attentive decidedly raised. When working or excited can be carried over the back, but never curled.

04: Limbs: Forequarters

General Appearance: Regular, upright seen from the front and in profile.

Shoulder: Shoulder blades long (30 % of the height at withers), well laid back (52 – 55°), muscular, strong and closely attached to the chest, but moving freely. The scapulo-humeral angle ranges from 110° to 115°.

Upper Arm: Muscular, of thin bone structure, as long as the shoulder blade; its inclination to the horizontal ranges from 58 – 60°.

Elbow: Well attached to the chest wall, but not too tightly; covered with thin skin; parallel to the median sagittal plane of the body as are the upper arms. The tip of the elbow is located on a vertical line lowered from the back end of the scapula to the ground.

Forearm: Perfectly vertical, long (36 % of the height at withers), with compact, strong bone of oval cross-section).

Carpus (Wrist): Viewed from the front in a vertical line with the forearm; fine, robust and mobile; pisiform bone markedly protruding.

Metacarpus (Pastern): Rather less thick and of finer bone compared with the forearm, it's fine and resilient. Seen in profile, it forms an angle of 75° to 80° with the ground.

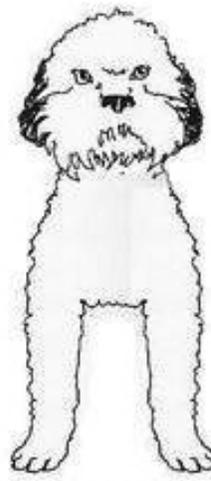

Forefeet: Slightly rounded, compact, with arched and tight toes. Nails strong and curved. Pads well pigmented. Interdigital membranes very well developed.

Correct

Inward turned
feet, incorrect

Turned out feet,
incorrect

05: Limbs: Hindquarters

General Appearance: Powerful, upright seen from the rear, well-proportioned to the size of the dog and parallel.

Thigh: Long (35 % of the height at withers), with clearly defined and visible muscles. The axis of the femur has a distinct inclination of 80° to the horizontal. The coxo-femoral angle ranges from 105° to 110°. The thigh is parallel to the median plane of the body.

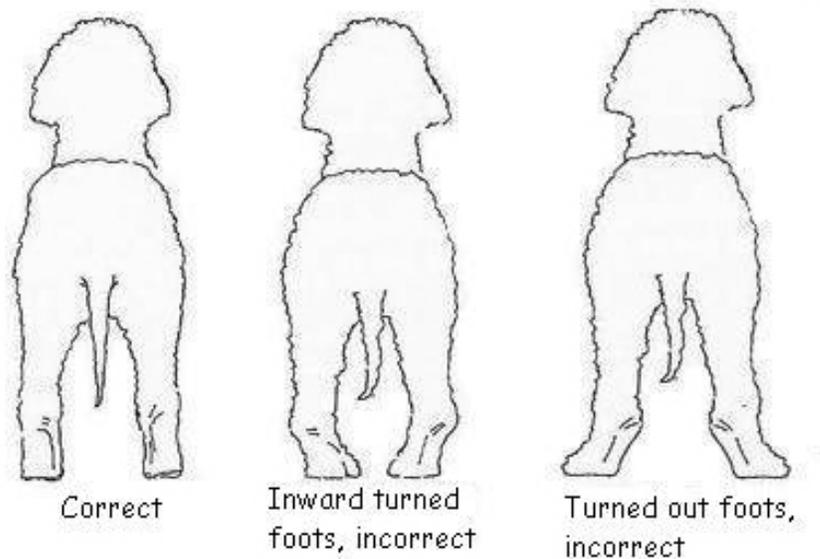

Stifle (Knee): The angle of the stifle ranges from 130° to 135°.

Lower Thigh: Slightly longer than the upper thigh (36 % of the height at withers), well boned and muscled, with marked muscular groove. Its inclination to the horizontal ranges from 50° to 55°. Its direction is parallel to the median plane of body.

Hock Joint: Wide, thick, lean, with clear-cut bone; parallel to the median plane of the body; the tibio-metatarsal angle is ca. 140°.

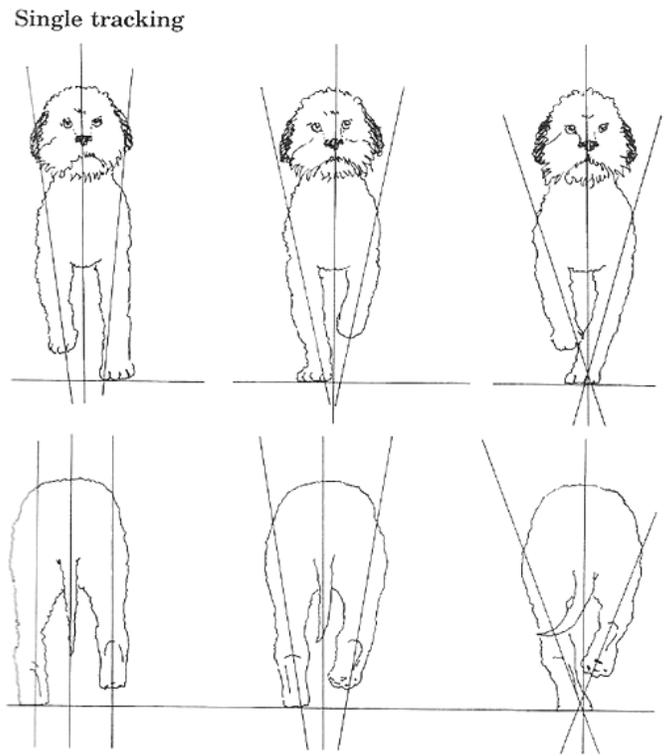

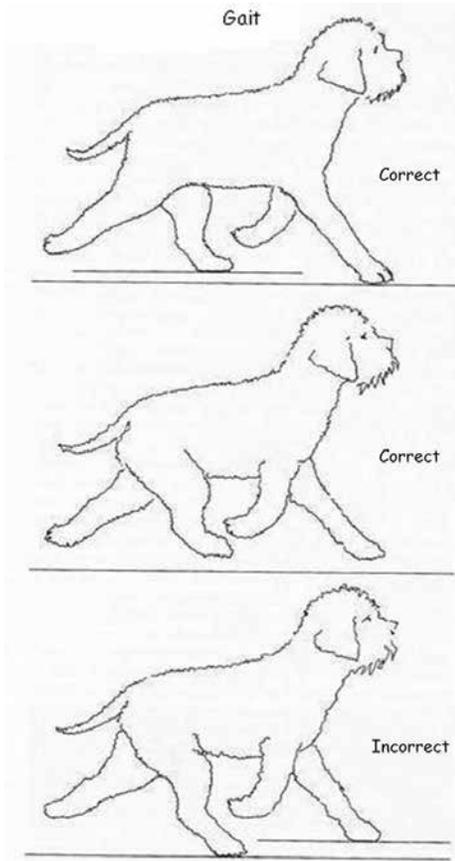

Metatarsus (Rear Pastern): Thin, cylindrical, perpendicular to the ground. No rear dewclaws.

Hind Feet: Slightly more oval-shaped than forefeet and toes slightly less arched.

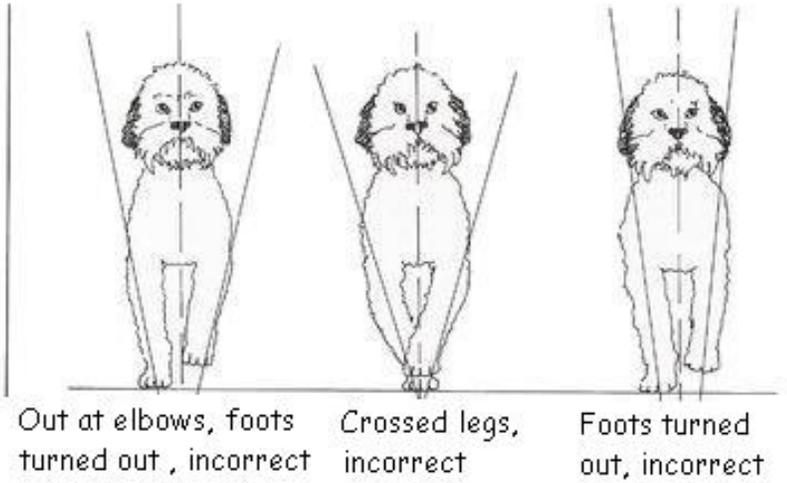

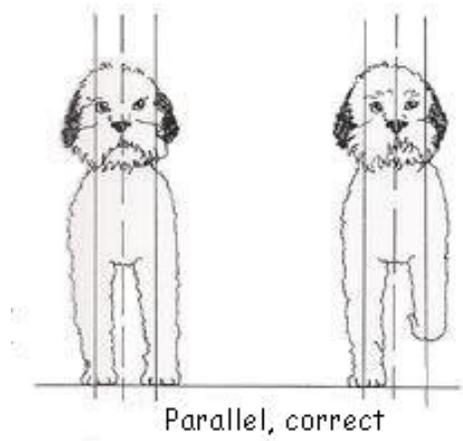

06: Gait/Movement

General Appearance: Walk regular, trot energetic and brisk, gallop for short periods.

Walking

07: Skin/Coat/Size

Skin: Thin, close fitting all over the body, without wrinkles. Pigmentation of the skin connecting with mucous membranes and of pads ranges from light to dark and very dark brown.

Coat/Hair: Of woolly texture, never twisted to form thin cords, semi-rough on the surface, with tight, ring shaped curls, with visible undercoat. Curls must be evenly distributed all over the body and tail, except on the head, where the curls are not as tight forming abundant eyebrows, whiskers and beard. Even the cheeks are covered with thick hair. The topcoat and specially the undercoat are water-proof.

If not clipped, the hair tends to become felted (as it continuous to grow); therefore a complete clipping must be performed at least once a year. Felted topcoat and undercoat must be removed periodically. The clipped coat must not be thicker than max four centimetres and it should be uniform with the silhouette of the dog. Only on the head the coat can be longer, but not as long as to cover the eyes. The area around the genitals and anus should be clipped short. The coat must not be formed and brushed up in the fashion of the Poodles and Bichon frisé breeds. Coat clipped short preventing it from curling or assessment of texture. Any excessive hair-styling will exclude the dog from being qualified. The correct clip is un-pretentious and contributes to accentuate the natural, rustic look typical of the breed.

Color: Off-white solid colour, white with brown or orange patches, brown roan, brown (in different shades) with or without white, orange with or without white. Some dogs have a brown to dark brown mask. Tan markings (in different shades) allowed.

Height at the withers: Dogs 17-19 inches Bitches 16 -18 inches Tolerance of ½ inch

Disqualification: Dogs under 16 ½ inches or over 19 ½ inches. Bitches under 15 ½ inches over 18 ½ inches. Above or below height is not a DQ but highly undesired.

Weight: Males: 28 lbs to 35 lbs Females: 24 lbs to 31 lbs

06: Faults

Any departure from the foregoing points should be considered a fault and the seriousness with which the fault should be regarded should be in exact proportion to its degree and its effect upon the health and welfare of the dog and on its ability to perform its traditional work.

Disqualifying Faults

- » Aggressive or overly shy
- » Any dog clearly showing physical or behavioural abnormalities shall be disqualified
- » Untypical specimen
- » Axes of the skull and the muzzle converging
- » Partial and/or total de-pigmentation
- » Dish-faced
- » Overshot bite
- » Pronounced undershot bite (Exceeding 3mm separation)
- » Wall-eye
- » Tail carried over the back; anury or short tail, whether congenital or artificial
- » Mono or bilateral rear dewclaws
- » Docked tail
- » Coat not curled or clipped too short
- » Corded coat
- » Sculptured clip
- » Black coat, black patches or black pigmentation
- » Oversize or undersize (Tolerance of 1 cm more or less)

Eliminating Faults (Excluded from Breeding)

- » Overshot bite
- » Cryptorchidism; unilateral
- » Wall-eye
- » Black coat, black patches or black pigmentation

Male animals should have two apparently normal testicles fully descended into the scrotum.
